

Google Workspace

Google Workspace cloud-to-cloud backup

That's CLOUD 2 CLOUD

With CLOUD 2 CLOUD, data can be encrypted and transmitted DIRECTLY to MOUNT10 and stored under SWISS FORT KNOX conditions simply, securely, and without detours.

The CLOUD 2 CLOUD web portal connects to the Google Workspace platform. The Gmail, Drive and Classroom data are selected and saved directly to MOUNT10 on a regular basis.

Functions and advantages

SWISS FORT KNOX I & II

The data is encrypted and stored redundantly in Europe's most secure data centres. The data is stored exclusively in Switzerland.

Web-based backup

No software needs to be installed with CLOUD 2 CLOUD. Thanks to the direct connection between Google Workspace and MOUNT10, the backup is performed automatically on a daily basis.

Data recovery

Data can easily be restored to Google Workspace. Instant data also provides the ability to restore data directly to local infrastructure.

Service Operation Center (SOC)

MOUNT10 checks the backup process daily and proactively creates logs in case of any anomalies. The SOC is always happy to answer questions 24/7.

End-to-end encryption

The data undergoes AES 256-bit encryption locally on the Google infrastructure before being transferred. This means that only the customer has access to the data.

Password

The password generates an encryption key. This way, only the owner of the password can access the data. If lost, the data cannot be recovered.
